

(R1) { Hi, how are you?
fine, what about you?

(R2) { My name is Peepak

(R2) { What is my name?
I don't know your name?

(R1) { Hi, how are you?
fine, what about you?

(R2) { Hi, how are you?
fine, what about you?
My name is Peepak

(R3)

Hi, how are you?

fine, what about you?

My name is Peepak

What is my name?

Peepak

Stateless.

(R4)

My name is Peepak

What is my name?

x x x x

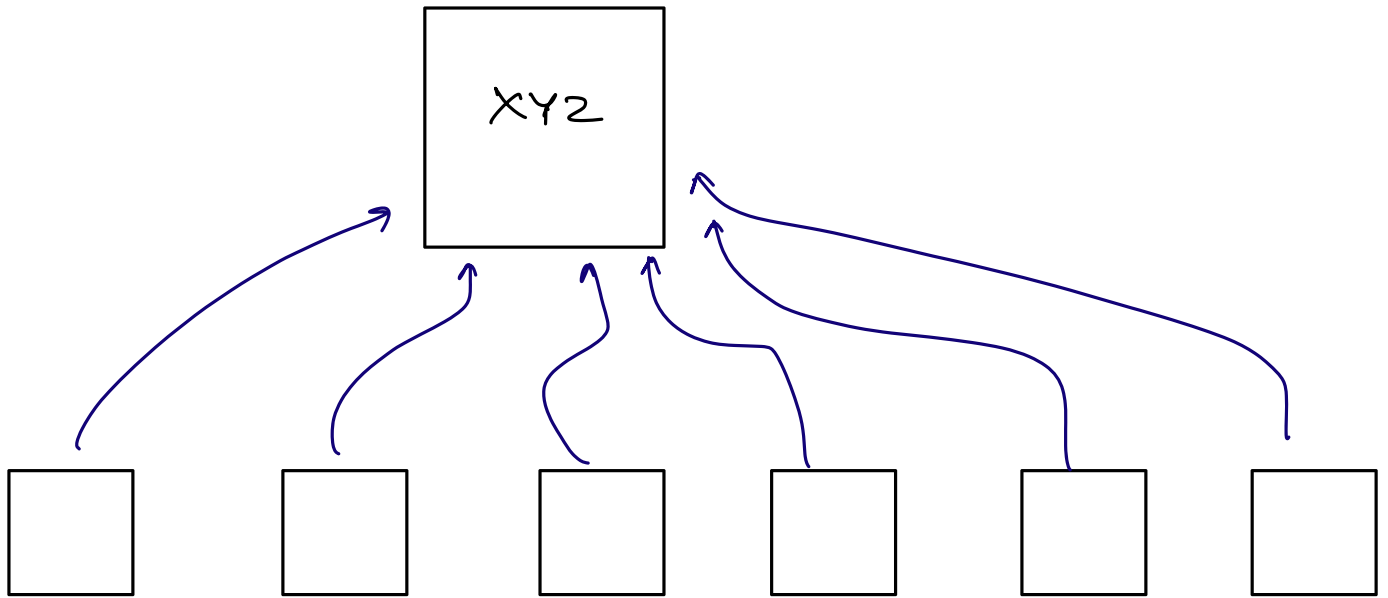

Context Window.

→ Amount of text our LLM can process at a time.

→ 1M tokens.

Memory

Memory in AI agents refers to the ability to store, retain & use the past information in order to make better decisions in the present & future.

Why memory is important for Agents ?

- remember past context
- track progress
- User experience
- Avoid repeating mistakes

Memory (vs) Context Window

Context Window

↳ Amount of text our LLM can process at one-time

→ recent conversations.

Memory

↳ Information stored beyond the immediate prompt & can be reused later.

Stateless (vs) Stateful Agents

Stateless Agents doesn't retain any information from the previous interactions unless it is passed explicitly in the prompt.

⇒ Every request is treated independently.

Stateful Agents. retains information over time & uses this information for future interactions.

Types of Memory

- Short-Term Memory
- Long-Term Memory
- Working Memory
- Episodic Memory
- Semantic Memory
- Procedural Memory
