- Error Handling ✓
- Middlewares ✓
- background Tasks.

Async APIs.

→ Sync (vs) Async
↓
Blocking ↘ Non Blocking

Async API is the API endpoint that can handle other requests while performing other operations

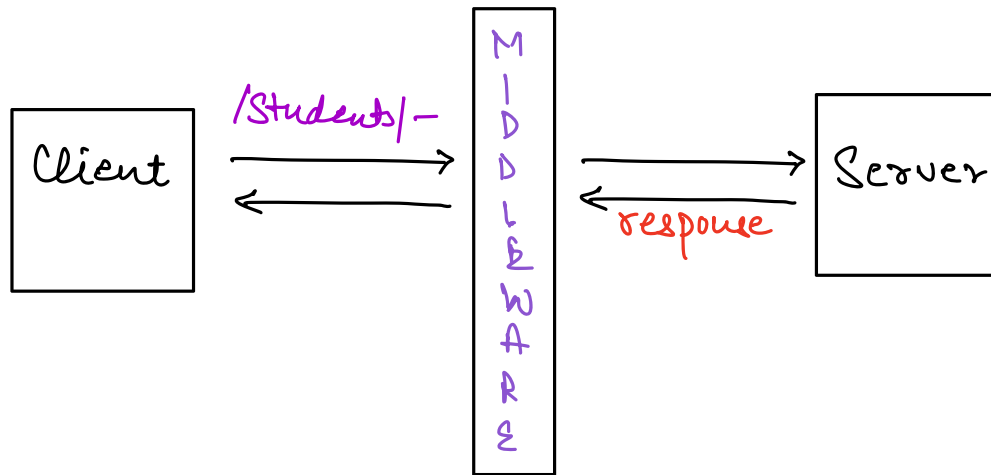

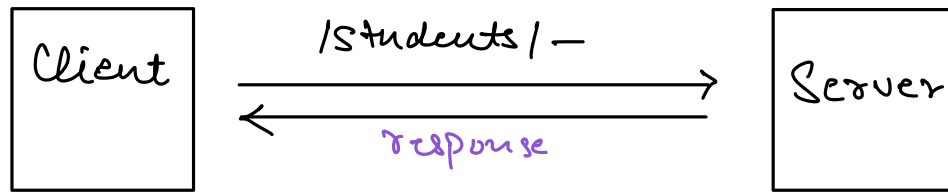

- Database Calls
- External API calls.
- I/O operations

→ Instead of blocking the server, FastAPI allows the server to execute other APIs.

Error Handling

↳ Managing the situations where something goes wrong in our API.

Middlewares.

Client Request

Middleware (Before processing)

Server.

Middleware (After processing)

Client Response.

Middleware runs two times :

- 1) Before the request reaches to the endpoint
- 2) After the response sent
